

## Skills

---

**Languages** Bash, C#, C++, C, Elixir, Erlang, Haskell, JavaScript, Perl, Python, Rust, SQL, Scala, TeX  
**Technologies** Linux, PostgreSQL, HTML, CSS, WebExtensions, X11, x86 ASM, IRC  
**Tools** Vim, Git, GNU Make, GitHub Actions, Jenkins, QuickCheck, Docker, Ansible

## Experience

---

- Staff Software Engineer** Moody's Analytics (London, UK) **2022–**
- Subject Matter Expert on Developer Experience (CI/CD, developer environments, git).
  - Moved local dev env to GitHub Codespaces, enhancing collaboration and freeing local resources.
  - Reduced dev env startup from over 1 hour to just 5 minutes, saving engineers 100+ hours monthly.
  - Fixed docker-in-docker startup in the upstream devcontainers universal image.
  - Pioneered good git practices across the company. Educated others about advanced git workflows.
  - *Tech:* Rust, Python, C#, Docker, Kubernetes, CircleCI
- sabbatical** (Guildford, UK) **2020–2021**
- Joined the XMonad project as a core maintainer. Contributed fixes, features. Reviewed pull requests and helped 2 other people join the project. Directed a release. Launched crowdfunding.
  - Implemented CI for taskwiki (taskwarrior integration for vimwiki) using Docker and GitHub Actions. Contributed a number of fixes and became a co-maintainer.
  - Improved Language Server Protocol support (rename, code actions) in Async Lint Engine for Vim.
  - Upped my Python skills, released strava-offline, strava-gear, arbt-chart, foursquare-swarm-ical.
- Software Engineer** Altworx (Brno, CZ) **2019–2020**
- Collaborated on a real-time event processing system with physical and cyber security applications.
  - Prototyped a 100× faster storage engine for the reality network (time-travelling graph database).
  - Discovered, investigated and fixed several fundamental issues in the event processing pipeline.
  - Addressed technical debt using static analysis tools (linting, types) and a custom testing framework.
  - *Tech:* Elixir, PostgreSQL, Kafka, Docker, Jenkins, BitBucket Pipelines
- Principal Software Engineer** GoodData (Brno, CZ) **2017–2019**
- Ran continuous integration and deployment infrastructure and build tooling for 100 engineers.
  - Reviewed and merged hundreds of pull requests across multiple repositories.
  - Sped up our JIRA deployment so much that I got Thank-you emails from the grumpiest engineers.
  - Contributed patches to jenkins-job-builder and python-jenkins. Became a co-maintainer of both.
  - Made builds of dozens of components more reproducible, secure and scalable using Docker.
  - Set up a merge queue for the legacy monolith with 4-hour integration tests, saving its developers hours of wasted time every week.
  - Built a tool for tracking individual test failures in JIRA, helping developers of shared codebases.
  - *Tech:* Python, Perl, Bash, Jenkins, Zuul, Groovy, Java, Docker, Puppet, RPM

- |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                     |                  |

## Education

---

### Computer Science

Masaryk University (Brno, CZ)

2006–2013

- Specialized in Parallel and Distributed Systems. Member of the ParaDiSe lab.
- Redesigned the e-learning software for typesetting exam test sheets: improved layout to avoid page/column breaks in multiple-choice; added support for advanced formatting, images and mathematical formulae. The system is still in use today. *Tech*: LaTeX, Haskell
- Typeset the Brisk Guide to Mathematics, a textbook for the undergraduate math curriculum.
- Teaching assistant for Introduction to Functional Programming; Automata and Grammars.

### Scientific Computing

Universität Wien (Vienna, AT)

2010

## Personal

---

**Technical blog.** Popular articles: [Side by side git-range-diff](#); [Linux, media keys and multiple players](#); [Even faster bash startup](#)

**Free and open-source software.** Contributed hundreds of patches, released dozens of small projects, joined several mid-sized projects as a (co-)maintainer.

- Maintainer of the XMonad X11 window manager. Ex-commmitter to the Fluxbox WM.
- Prototyped Linux support for external monitors on dual-GPU laptops (Nvidia Optimus).

**Cycling.** Won 3 alleycat races (and a few more podium finishes). Built several cycling-related tools:

- [strava-map-switcher](#) is a browser extension for Strava with over 4000 users adding better maps.
- [strava-offline](#) keeps a local mirror (backup) of Strava activities for further analysis.
- [strava-gear](#) is a rule-based tracker of gear and component wear.
- [locus-rflkt-addon](#) connects Locus Map (Android app) with Wahoo RLKFT (cycling computer).
